

Submission

- **Video Walkthrough (Required):** Record a video walking through your solution. Cover how you approached the problem, key architectural decisions you made, and — importantly — how you used AI tools in your workflow. This includes what you prompted, where AI accelerated your thinking, and where you had to reason through things yourself. The video should make it clear you understand every part of what you built.
- **Live URL (Optional):** If you have deployed the application, share a live link. Candidates who provide a working hosted demo will be evaluated more favorably.

Task 1: Browser-Based Coding Sandbox

Execution Speed + AI Leverage + Full-Stack Foundation

Scenario

You are building the core of a browser-based developer assessment environment where candidates can code, run projects, and complete interviews entirely from the browser without any local setup.

Requirements

Build a browser IDE-like environment where users can:

- Create, edit, and delete files and folders.
- Run and preview projects live.
- Persist project state across sessions.
- Install and use external npm packages.
- Experience near real-time updates within the sandbox.

Skills Being Judged

Skill	What We Evaluate
AI Leverage	Efficiency in using AI tools (ChatGPT, Claude, Cursor) to accelerate delivery.
Prompt Engineering	Quality of prompts and workflow integration.
Speed of Execution	Delivery speed and ability to meet technical deadlines.
Full-Stack Implementation	MERN execution quality and state management logic.
Developer Workflow	IDE-like UX thinking and session persistence decisions.

Deliverables

- A working MERN application with a functional browser sandbox.
- A README explaining your architecture, AI usage strategy, technical tradeoffs, and known limitations.

Red Flags

- Blindly copied AI code without understanding it.
- Broken or missing session persistence logic.
- Fake or non-functional live previews.
- Cannot explain any architectural decision when asked.
